100% Satisfaction Guarantee

Policy applies only to products manufactured directly by or directly for EHS Racing. The time period for this policy is 30 days after delivery of items, if for any reason you the customer are unhappy with a product it can be returned to EHS Racing no questions asked. If the product was sold directly by EHS Racing we will provide money back, store credit, whatever the customer prefers. If item was purchased through a dealer or distributor we can only offer a trade allowance towards another item equal to the same value. If cash back credit is needed it must be returned to the original place of purchase. We do not cover or refund return shipping expenses and original shipping expenses, these will be forfeited by customer. After 30 days an EHS Racing product can still be returned for store credit only up until 60 days from time of delivery. After 60 days no returns will be accepted unless their is a manufacturer defect, but the decisions solely lies with EHS Racing whether an item is defective or not.

Agreement:

EHS Racing manufactures after market parts and accessories that can be used for racing. These parts are intended for use by professionals that have proper experience in operating the equipment that those products were designed for. These products are to be installed by qualified technicians whether it be yourself or dealer, by installing any products manufactured by EHS Racing or directly for EHS Racing you assume all liability for any damages direct or consequential resulting from the installation. EHS Racing's liability extends to product replacement only.

This EFI is mapped specifically for the 2019+ grizzly 700's do not use tuner for older style grizzly's. AND do not use older tuner on 2019 grizzly's the maps are different

Installation Instructions

Idle Fueling Instructions Supplement

The 2019 Grizzly 700's are very picky about idle fueling from our testing they run slightly rich at idle but turn very lean as soon as the throttle is pushed (sees increase of TPS signal). This makes it important to set the controller correctly so it adds fuel as soon as you are pushing the throttle but not at idle.

This is controlled exclusively with the 4th mode green blue. The tuner will be pre-set at a setting of 5. If you lower the setting to a 4 from 5 it has nothing to do with the fuel quantity but it does tell the fuel adding circuit to turn on sooner (lower RPM/TPS.) If you raise the setting to a 6 it will not add any extra fuel but it will tell the green circuit to activate slightly later (higher RPM/TPS).

You want the controller while the atv is running to blink green lights at idle but turn to solid lights when the throttle is pushed. Blinking lights (in operational state which is what the atv runs in and not when pushing buttons) means that NO extra fuel is being added. Extra fuel begins as soon as the lights turn solid regardless if its 1-2-or 3 lights.

If you push the throttle and raise RPM the controller should turn to solid lights, then back to blinking while its at idle. If the lights stay solid after atv returns to idle, you will need to raise the 4th mode 1/2 a point at a time until it is set correctly. (odds are you will not need to change this but should be verified before using it will not do any harm if it adds fuel at idle other than a occasional fouled spark plug during cold start).
